

BITS FOR PILE FOUNDATION

BITS FOR PILE FOUNDATION

Types of Pile Foundation

- Pile foundation can be divided into two types: end bearing pile and friction pile.
- The former refers to the pile through the soft soil and reach the rock or hard soil;
- The latter refers to the pile hanging in the soil and bearing the weight by using the friction between the pile and the soil.

The Characteristics of Pile Foundation

- Pile foundation construction workload is large, generally a project to the construction of dozens to hundreds of piles, and often need to be completed in a short time, pile into more procedures, need to cooperate with more work.
- When drilling holes with washing fluid, the site is not easy to dry and level, and the amount of slag discharge is large.
- The outdoor operation of pile foundation construction is greatly affected by natural conditions, and the construction conditions are different from one project to another.
